

Task 1 — Lab Document Practice & Prompting Report

1- Novice vs. Power User

When I gave simple input it just gave me general options of best phones which does not meet my budget and also they are high specs.

And when I provide context it gave me exact phone which are according to me my need and budget.

2- Knows vs. Guesses

So when I ask general science question, it gave me answer as per my question.

And when I asked something new regarding specific news which is not most common it tried to give answer but at the end it mentioned that this is not exact and asked me more question or context so it can give me best answer. But still it tried to give answer

3- The 3 Retrieval Modes

When I asked “Pretrained” and “Web search” question, it gave me quick result with my desire answer.

When I asked with Deep Search method, it gave me detail answer and also generated proper report on my question as per my need also gave a summary of the report at the end of it.

4- Context Is Everything

So when I provide context on each prompt it gave me exact thing without any large sentences. Kept it short and according to my need. What I learnt from context is everything, is that context is really important if you want to have exact answer. Because providing context gives AI a information which defines its answer in a better way.

5- Think Hard

Yes, “Think Hard” search deeper and provided me very well answer, and when I just reply the AI to think hard and again on the same question, it provided me more detail compression on my question and provided more details of it. So asking for think hard actually pushes AI to give best option.

6- Stop the Flattery

So when I asked with “Do you agree” or “Don't you think” command, it actually didn't 100% agree but still it kept the answer to my side. But when asked to provide both side review and don't suggest it gave me both sides reasons and changed the answer.

This is one answer I hadn't thought:

Best suited for: Night owls, people who want to lift heavier or perform at peak capacity, or those who need exercise as a way to unwind after work.

7- The Brainstorm–Iterate Loop

Yes, when we gave our input on AI answer and refined it's last answer and doing so actually tell the AI the what we are actually looking for and it always a good thing to keep giving our input to AI's answer.

8- Multimodal — Image & Audio

So when I provided a handwritten text image to AI, it actually corrected the spelling mistakes as well.

And when I asked to summaries it and give important bullet points it changed does not write the exact text but it gave the points and highlighted important parts of it.

9- Build a Small App

So when i initially build the application it actually created a html based application and worked fine, means it's functionality is working fine. Also after giving iterate step it changed the them and color but the basic app functionality was same and it didn't changed it.

10- Data Analysis

Both cases using with code and without code gave the correct answer, but when I asked to write code it actually write the code in python and gave the exact program which it ran. Seem that when we asked without code, it actually ran the code in backend and gave answer as a text only.

11- Desktop Apps & Permissions

I would never allow write access on my folder on day one also do not give access to any additional directory to AI, I will keep it to specific folder where I need to perform task only.

12- Which Model When

So switching between Instant and Thinking model in ChatGPT changes the result. Instant one gave normal timeline with less details, but Thinking one gave detailed step by step time line with proper justifications.

13- Models Checking Models

I asked to score with ChatGPT and Gemini, both gave different score to ChatGPT's response.

Task 2 — AI Generated Snake Game

My game url is :

<https://sohaibkhan.github.io/AI-101-Lab/snake.html>

My initial prompt was:

create a simple snake game where snake can be controlled with arrow key to move left right, up/down snake can go through corners and upside and downside there should be an apple like object which snake would eat and grow also when it eat apple it should increase its score by 1 number

It created a good game but the issue appears when snake touched it's tail, the hanged up.

So i iterate it with second prompt and update the game feature as well, it gave me 2nd version of it.

My 2nd prompt was:

ok when it touches it's own tail it should not end the game but to end the game there should be a bomb like object come for after every 5 apple for 5 seconds it snake it it is should end the game and gives option to restart instead of just hanging
